

My SharePoint 2016 Hybrid scenario

<http://sharepoint-tutorial.net/page/ebook-install-sharepoint-2016.aspx>

I used the following scenario to enable all hybrid features:

The on-premise environment is completely virtualized with Hyper-V:

1. There's an on-premise Active Directory with a domain 'domserver.com' and a user 'Don Funk'.
2. A SharePoint 2016 server hosts content and imports user identities from AD.
3. All SharePoint data is stored in a SQL Server 2014.

SharePoint 2016 hybrid features should be enabled to integrate on-premise content and users with Office 365:

4. My public URL 'andreasglaser.com' is verified within my Office 365 subscription.
The user Don Funk should be able to sign in to the on-premise and cloud environment using the same username 'donf@andreasglaser.com' and password.
5. The identity synchronization tool is installed on the SharePoint server.
Also server to server authentication is enabled to connect the SharePoint server with the cloud.
6. Hybrid features including site following, profiles, OneDrive for Business and cloud search are configured on the SharePoint server.
